## Research interests

Superfluid helium, quantum vortices in superfluids, (time-dependent) density functional theory, Monte Carlo methods, atomic- clusters and cluster collisions, high performance computing, data visualisation

## Programming languages, methods, etc.

Fortran

- Parallelisation and optimisation of in-house written code to simulate the quantum dynamics of superfluid  $^4\text{He}$  using time-dependent He-DFT. Code optimised using Intel's MKL to run on Calmip/EOS, in collaboration with Nicolas Renon and Emmanuel Courcelle from Calmip.
- Publication on Github for public use, with accompanying material explaining the method and how to use the code, with included example calculations:
  - <https://github.com/bcntls2016/4hedft>
  - <https://github.com/bcntls2016/4hedft-vortex>
  - <https://github.com/bcntls2016/4hetddft-isotropic>
  - <https://github.com/bcntls2016/4hetddft-anisotropic>
- Prepared and taught a 2-day workshop on using He-DFT during the CECAM summer school: <https://www.cecarn.org/workshop-1381.html>

C/C++

Self-written code:

- Ising model (Metropolis and Wolff), study of critical behaviour.
- Nematic liquid crystals (Metropolis), behaviour of topological defects on constrained geometries in the presence/absence of curvature.
- Code profiling and optimisation (using GCC/GProf) for local computer cluster at Lorentz Institute for theoretical physics, Leiden, The Netherlands.

Data analysis  
and  
visualisation

- Gnuplot (2D)
- Python / Matplotlib (2D)
- Paraview (3D)
